COVER LETTER | SOFTWARE ENGINEERING

Dear Hiring Manager,

I'm applying for an entry-level software engineering opportunity with your team. As a Rutgers University Computer Science graduate, I've learned to translate requirements into working software and, importantly, to support a system that people rely on in their daily work.

I built and deployed a prescription refill management system using Python, Flask, MySQL, and JavaScript. Pharmacy staff use it to process approximately 100 prescriptions each day, and the move away from a manual workflow reportedly reduced processing time by 30%. That experience taught me to think beyond implementing features: reliability, clear workflows, and maintainable backend design matter when real users depend on an application.

My academic and project work has also included a real-time auction platform with concurrent bid handling and an AI meal planner using heuristic search, machine learning, and nutritional data. These projects strengthened my understanding of database-backed services, validation, tradeoffs, and collaborative problem-solving.

I would welcome the opportunity to contribute to your engineering team while continuing to develop my skills. Thank you for considering my application. I look forward to discussing how my experience could support your work.

Sincerely,

Ali Rehman
